

**TruStar**

**DISC & DRUM BRAKE  
HARDWARE KITS**

**GUIDE PINS**

**SELF ADJUSTING  
REPAIR KITS**

**Brake professionals agree that hardware is essential for a complete brake job.** TruStar works diligently to deliver parts that are the best quality and value at a reasonable price. Our replacement brake parts, known for their reliability, are used by installers across North America and in top quality OEM remanufactured service calipers. The complexity of modern OEM braking system requires that all brake system components be inspected and replaced to guarantee that the braking system is fully restored to “like new” performance levels. Replacing brake hardware when installing new parts helps eliminate noise complaints and reduces costly comebacks.

Brake hardware is subject to the same wear and tear as pads, shoes, discs and drums. When new hardware is installed, calipers slide smoothly, drum brake assemblies actuate evenly and the vehicle's braking performance is improved. Like brake pads or shoes, pad clips, bushings, guide pins, springs and adjusters are mechanical parts and eventually wear out. Whenever the brakes are replaced, these parts should be inspected and replaced as well. Wear and corrosion on these parts require more than cleaning and grease to maintain the performance of the braking system. With time and use drum brake springs fail and tension is reduced. TruStar branded hardware is engineered to meet or exceed SAE specifications. Through testing and rigorous comparison to OEM parts, we ensure that our replacement parts are designed to function as original parts, increasing customer satisfaction and reducing comebacks.
