WHEEL CYLINDERS

We never forget that brakes are the most important safety system in a vehicle. TruStar is a pioneer at the forefront of international sourcing, securing product that meets our exacting specifications. Our hydraulic line is verified by on-site quality control inspectors and engineers. The use of proprietary equipment and the insight of independent laboratories guarantees that TruStar branded products meet our standards for safety and quality. By retaining talented individuals, global partners and using cutting-edge technology we can deliver a superior product that is competitively priced.

CONI-SEAL
The Undercar Source

TruStar brand brake hoses meet SAE Standard J1401 and are approved by the Department of Transportation. Boasting zinc plated end fittings, they meet our high standards for quality.

Our master cylinders are new, not remanufactured. They are factory tested to assure that there are no flaws in the final product. All units are tested to simulate actual operation. A bleeder kit is included in every box and since they're new—no core returns.

The conduit used in our TruStar branded brake cables is constructed with heavy custom flat, laminate wire for improved strength and superior flexing. The inner wire is coated with PA6 (Nylon 6) and the conduit is lined with PEHD, Polyethylene High Density. The outer conduit is bonded with PVC.

Our wheel cylinders are tested on low pressure computerized equipment in an on-going effort to maintain consistent product quality. The brake cups meet SAE Standard J1601 and the bleeder screws are case hardened for longer life.
